## DETAILED ACTION

### *Allowable Subject Matter*

1. Claims 1-8 are allowed over the prior art of record.
2. The following is an examiner's statement of reasons for allowance:

As per the independent claims, the claim recitations toward using a portion of the lowband signal to modulate noise for the highband excitation is not explicitly taught by the prior art of record.

With respect to the prior art of record, Tucker et al (6675144) Fig.5 (and column 12, lines 3-21) has the excitation being the weighted sum of periodic (pitch) pulses plus noise; there is no suggestion of using a portion of the lowband signal to modulate noise for the highband excitation; pitch pulses are not a portion of the lowband. Liljeryd et al (6925116). is a general spectral expansion method which is performed after the decoding; see Liljeryd Fig.1. That is, both the claims and Tucker synthesize wideband speech from encoded lowband and highband information; whereas, Liljeryd takes already-synthesized lowband signals and fabricates a highband to add to the lowband to create a wideband signal. The time-domain excitation of an LP filter in the claims and Tucker has no relation to the frequency-domain spectral expansion of Liljeryd. Consequently, Tucker plus Liljeryd do not suggest the decoding claims.
